GEOQUIP WATER SOLUTIONS MAKES A SPLASH AT ITALIAN EXHIBITIONS

Geoquip Water Solutions recently attended the REMTECH and GEOFLUID exhibitions in Italy and were overwhelmed by the interest shown in the Laval R-Cam 1000 downhole video camera and the Boresaver range of cleaning solutions for iron oxide, manganese oxide and calcium carbonate.

REMTECH 2010

GEOFLUID 2010

"We met a large number of new and existing remediation clients at REMTECH and were able to review some of our current projects. We noticed a significant increase in enquiries about site remediation – our conclusion was that the maintenance and remediation of hydraulic barriers are paramount to the success of any treatment," said Mike Deed, Managing Director at Geoquip.

Attendance at the exhibition and symposium was at an all time high, with registration sold out before REMTECH started, confirming its place as one of the premier remediation events in Europe.

"We had one of our most successful shows at GEOFLUID," continued Mike. We had 25 enquiries about the Laval R-Cam 1000 downhole video camera from hydrologists and drillers based as far afield as Kuwait, Turkey, Spain, Hungary, the UAE, Nigeria and Thailand. We were overwhelmed by the interest shown in Boresaver, the cleaning solution for iron oxide, manganese oxide and calcium carbonate, and were also able to attend some demonstration meetings in between the two exhibitions."

At the demonstration meetings, Stripper Tower elements were used to show the effectiveness of a Boresaver treatment. The elements were immersed in a combination of Boresaver products for only 10 minutes and the results, as always, were impressive.

Stripper tower elements: The element on the right is covered in iron oxide residue. The clean element on the left was in an identical condition before being immersed in a combination of Boresaver products for only 10 minutes.
